

INDEPENDENT REVIEW REPORT

Adversarial structural review

A first-pass challenge to the verdict taxonomy, evidentiary architecture and political direction of a public corpus tracking Indian government policy claims.

SCOPE	226 ledger records 127 provenance records 269 series omitted 60 pairs omitted
SOURCE	pass-a-structural.md
METHOD	Adversarial structural comparison of verdict definitions, record metadata, source tiers and phase distributions

Bottom line: the corpus does not apply one stable burden of proof. Its no-objective and contested rules protect some government claims, while its directional provenance labels lean against the government by 19:6.

Findings at a glance

#	Severity	Finding
1	Critical	No-objective contradicts its definition and shields undated commitments
2	High	Three corrected verdicts still argue for the withdrawn class
3	High	Similar multi-objective records receive incompatible verdicts
4	High	Contested is being used as an ignorance category
5	High	The source-profile table omits the evidence layer verdicts rest on
6	High	Direction-of-bias labels are skewed and semantically inconsistent
7	Medium	Worked is implausibly term-clustered
8	High	The written method is not synchronized with the record set

Detailed findings

1

CRITICAL | No-objective contradicts its own definition and shields undated commitments

The verdict definition says no-objective applies where nothing was claimed. The commitment-state rule then orders the opposite: an explicit commitment with a total but no deadline must also be scored no-objective.

L-0209 exposes the contradiction. The government committed to fencing the entire 1,643 km Myanmar border. That is an objective. Its missing deadline makes it unfalsifiable by time, not nonexistent. **L-0210** likewise contains an explicit commitment to scrap the Free Movement Regime. **L-0213** files an announced corridor and later quantified benefit claims as no-objective because they lack delivery parameters.

Thirteen no-objective records have populated claim fields: **L-0184, L-0187, L-0206, L-0208, L-0209, L-0210, L-0211, L-0213, L-0215, L-0217, L-0218, L-0219 and L-0220**. Some correctly explain that no Indian commitment exists, but L-0209 and L-0210 do not. This rule leans pro-government because an indefinitely drafted promise can never become overdue while the verdict says nothing was claimed.

2

HIGH | Three of four awaiting-adjudication records still argue for the withdrawn verdict

The method says corrections are made in place and visibly marked. That did not happen for three records migrated from too-early to awaiting-adjudication:

- **L-0086** says: Scored too-early.
- **L-0127** says: Filed too-early on the written definition.
- **L-0134** says: Filed too-early.
- Only **L-0143** gives reasoning for its current verdict.

Thus 75% of this verdict class contains live reasoning for another class. The change-history table records the migration, but the records themselves violate the stated correction convention.

3

HIGH | Similar multi-objective records receive incompatible verdicts

L-0026 is worked although its own reasoning says two objectives were announced and they do not resolve the same way. Under the written definition, achieving only part of a stated objective is partly. **L-0048** is indeed partly on essentially that structure: two announced objectives with a split result. Unless omitted evidence establishes that both **L-0026** objectives were fully achieved, its worked verdict is unsupported.

A second inconsistency appears in later foreign-policy records. **L-0207** is worked despite stating that no tariff, revenue or export-volume target was retrieved; its reasoning admits it was scored on delivery only. **L-0206** and **L-0208** are no-objective because purpose or activity without a target is not scorable. **L-0212** is only partly where one commitment was delivered but the broader result was unmeasured. **L-0207** receives a success verdict through a test the method refuses to use for nearby records.

4

HIGH | Contested is being used as an ignorance category

The definition requires evidence supporting more than one defensible reading. The corpus's own ground classification instead assigns 11 contested records to evidence-withheld: **L-0042**, **L-0057**, **L-0070**, **L-0110**, **L-0114**, **L-0137**, **L-0144**, **L-0148**, **L-0168**, **L-0178** and **L-0179**.

Another five are evidence-unobservable: **L-0018**, **L-0056**, **L-0079**, **L-0116** and **L-0136**. These records often show insufficient evidence to choose a reading, not evidence affirmatively supporting two readings. **L-0096** makes the problem explicit: its outcome was never published and it has four unmeasured quantities, yet the method cites it as the model for retaining an unmeasured claim as contested.

The distinction between genuine conflict, missing evidence, withheld evidence and an unobservable counterfactual exists only as a project classification, not as a data field. Where the state controls missing evidence, contested also allows nonpublication to prevent an adverse verdict.

5

HIGH | The source-profile table cannot establish what it claims to establish

The verdict/source table tabulates ledger citations, while the extract says the omitted series contain the figures on which verdicts rest and carry separately tiered sources. The table therefore cannot determine what source type a verdict actually rests on.

- **L-0013**: failed, T3 x1 and T4 x2.
- **L-0014**: worked, T4 x1.
- **L-0016**: failed, T4 x2.
- **L-0017** and **L-0036**: partly, T4 x1.
- **L-0055**: partly, T3 x1.

The omitted series may rescue these high-confidence verdicts. If so, the table is structurally incomplete; if not, the verdicts are under-supported.

There is also an asymmetry inside the ledger layer. Seven of nine worked records have only one ledger citation: **L-0014, L-0023, L-0026, L-0029, L-0047, L-0052 and L-0053**. Worked averages 1.4 citations per record, versus 3.3 for failed, 2.9 for partly and 2.8 for contested. Its 13 citations are 12 T1 and one T4, with no T2 or T3 evidence. Unless the omitted series reverse this pattern, success is the least documented definitive verdict and is established almost entirely using Indian official material.

6 HIGH | The direction-of-bias field cannot support a clean political conclusion

Nineteen records say the instrument overstates or flatters post-2014 performance: **P-17, P-22, P-23, P-24, P-25, P-26, P-27, P-30, P-31, P-32, P-34, P-36, P-37, P-38, P-40, P-42, P-47, P-48 and P-63**.

Only six say post-2014 quantities are understated: **P-11, P-16, P-28, P-45, P-74 and P-85**. That is a 19:6, or 3.2:1, skew against the post-2014 government among records where direction is asserted.

- **P-11** infers direction from a higher non-food CPI weight, but a weight change alone cannot establish direction without relative component inflation.
- **P-36** labels a much lower logistics-cost estimate overstates-post-2014. The label means flatters performance, not that the numerical figure is overstated.
- **P-34** combines a nondirectional reporting gap with allegedly selective accident classification.
- **P-63** announces breaks on opposite sides of a ratio but assigns one direction without showing the net calculation in this extract.

The documentation is also stale: it says nondirectional values cover 35 of 58 records, while the current distribution is 100 of 127. It says overstates-pre-2014 has no users, although **P-122** uses it. The recorded directional findings lean against the government, but this file cannot establish whether that reflects real defects, record selection or unsupported direction assignments.

7 MEDIUM | Worked is implausibly term-clustered

Eight of nine worked verdicts belong to T1: **L-0014, L-0023, L-0026, L-0029, L-0047, L-0052, L-0053 and L-0151**. The only other one is T3 record **L-0207**. There are no T2 worked records, despite T2 containing 74 records and being a completed term.

T2 instead contains 32 contested, 19 no-objective, 11 partly, five failed, three too-early, three awaiting-adjudication and one reversed. Elapsed time cannot explain zero successes in a completed term. Term-specific selection, authoring-phase drift or inconsistent thresholds could explain it, but the extract does not establish which.

8 HIGH | The operative method is not synchronized with the record set

The too-early definition says the class has two remaining members, **L-0061 and L-0139**. The current extract contains 13: **L-0061, L-0139, L-0153, L-0155, L-0169, L-0188, L-0194, L-0196, L-0201, L-0204, L-0205, L-0223 and L-0225**.

Together with the stale provenance counts and the uncorrected awaiting-adjudication reasoning, this shows that the prose method is historical commentary rather than a dependable specification of the current corpus.

Overall political direction

The structural errors do not lean only one way:

- No-objective, missing-evidence contested verdicts and thinly sourced worked verdicts tend to protect or favour the government.
- Direction-bearing provenance classifications lean against the government by 19:6.

- The zero-success T2 distribution suggests term or authoring-phase bias rather than a simple partisan direction.

These effects do not cancel out. They show that different parts of the instrument apply different burdens of proof, making political direction depend on which taxonomy a record enters.

What I could not check from this file alone

- Whether the 269 omitted series and 60 pairs substantiate the verdicts or reverse the ledger-only source asymmetries.
- The full reasoning, case-for and case-against text for most records.
- Whether L-0026's full evidence establishes both objectives despite its contradictory reasoning sentence.
- Whether L-0207's sources contain an explicit construction or delivery objective omitted from its claim field.
- The calculations needed to establish direction for P-11, P-36 and P-63.
- Whether cited documents support the summaries and have been assigned the correct tiers.
- Whether the public site displays corrections, assessment notes, contested grounds and caveats clearly.
- The selection denominator: which government claims or policy areas were never entered into the corpus.
- Whether term clustering reflects the underlying policy universe or the order and topics in which records were authored.
