

Where the instrument breaks

Deep review of **pass-b-deep.md**: 73 full-prose records from a public corpus tracking Indian government policy claims.

WEAKEST CLAIM: L-0026 calls the measure worked after admitting that one of its two announced objectives is not established. The instrument's own definition calls that partly.

This report tests verdicts against the instrument's stated definitions, compares records with the same structure, checks whether sources support the claims made on them, and attacks the absence-search method. It does not edit the source extract.

Bottom line

The verdict errors lean in the incumbent government's favour. Search and absence errors are politically mixed, but repeatedly make each record's preferred narrative more definite than the documented search permits.

1. Worked is awarded when only part of the objective was established

- **L-0026** announced recapitalisation and stronger, more efficient banks through consolidation. Its note says consolidation is **not established**, yet awards **worked** because recapitalisation was the centrepiece. The method has no centrepiece exception.
- **L-0029** identifies three objectives, says only two were measured and met, and admits that eliminating ghost and duplicate beneficiaries was not measured. It also lacks a count of eligible people excluded by authentication failures. This is **partly**, not worked.
- **L-0047** establishes electrification, fuel savings and diesel displacement but expressly leaves the promised net-emissions reduction unmeasured. Its own note calls emissions part of the announced object.
- **L-0048** is the control. It correctly assigns **partly** because corridor performance improved while the modal-share objective was not met. L-0026 and L-0029 have the same structure and receive the more favourable verdict.

The anticipatory notes do not cure the defect; they confess it. Either these verdicts move to partly, or the method must disclose a rule permitting objectives to be weighted after the results are known.

2. L-0014 substitutes CPI and institutional survival for inflation expectations

L-0014 says flexible inflation targeting would anchor inflation expectations. The evidence shown is lower CPI, survival of the framework and its renewal. None is a measure of expectations. The note calls survival and renewal the strongest evidence available, but **worked** requires evidence that the announced objective was achieved, not the best available proxy.

The only listed source is a T4 Trading Economics item about renewal. Even if the omitted CPI series is sound, CPI is not an expectations series. The verdict is unsupported without a dated expectations measure and a success criterion fixed independently of the observed CPI path.

3. L-0207 invents an objective in order to award worked

L-0207 says no tariff, revenue or export-volume target was announced. It nevertheless awards worked because the plant was built and exporting, which the author says is what a joint hydropower project is for. That replaces an announced objective with an inferred one.

On the stated vocabulary, this belongs closer to **L-0206** and **L-0208**, both no-objective, unless an announcing document with a concrete commissioning or export objective can be produced.

4. Too-early is used for states its definition excludes

- **L-0188** calls the Interim Agreement due and undelivered, records a July 2026 target, and finds no concluded agreement by 4 August. It then invents a February 2027 re-test. A better tariff under different legal instruments does not deliver the promised agreement. On the record's own facts, the agreement limb has failed; at minimum, too-early is indefensible.
- **L-0205** repeatedly says the India-EU agreement is not signed or in force and that nothing binds until notifications are exchanged. Too-early expressly requires an in-force measure. A commitment awaiting its trigger is not the same state.

5. No-objective is made to mean two contradictory things

The formal definition reserves **no-objective** for cases where nothing was claimed. **L-0209** quotes an explicit commitment to fence the entire 1,643-kilometre border. A separate rule then declares an undated total not to be an objective because it cannot fall due.

Those are different findings. The honest class would be undated or unfalsifiable, not no-objective. The current label hides the politically material fact that a concrete, quotable promise has been made permanently incapable of becoming overdue.

6. L-0226 manufactures a contest from incommensurable quantities

L-0226 juxtaposes a rule about instructions to back renewable generation down with a modelled projection of energy not being absorbed. Its caveat says these are distinct quantities, and its strongest case for explains how both can be true. Yet the title and contested verdict are built from placing them side by side.

That violates the method's own rule for incommensurable quantities. No evidence currently supports two readings of one outcome; it supports two statements about different objects plus an absence of measured curtailment data. The caveat anticipates the objection but does not repair the central framing.

7. The stated-search rule is repeatedly ignored

The method requires an enumerated index, a verified archive convention or named routes exhausted before assigning **not-published**. It explicitly says that nothing retrieved is insufficient.

- **L-0210** admits the MEA channel could not be read and that it cannot distinguish published nothing from published something unreachable, yet assigns not-published to the FMR's status and instrument.
- **L-0224** admits the lodged 2015 NDC was not retrieved and may contain the missing carbon-sink reference. The evidence supports not checked in the most relevant document, not non-publication.
- **L-0209** inspects one Year End Review and treats absence from the natural place as sufficient. The method expressly requires more.
- **L-0026, L-0029, L-0047 and L-0207** use formulations such as no evaluation retrieved, no count retrieved and nothing retrieved states, without documenting a qualifying search.
- **L-0116** escalates from limited retrieval to universal claims: no published series exists, no written order has ever been published and no body has published a series. These are the negative existentials prohibited by rule 5d.

The political direction is mixed. Unsupported absences protect worked verdicts in L-0026, L-0029 and L-0047, while strengthening criticism of opacity in L-0209, L-0210 and L-0116.

8. The source ladder is not being followed

- **L-0015** labels a Business Standard news article T1. Under the explicit journalism rule it is T4.
- **L-0114** labels a High Court judgment retrieved from a Bar and Bench mirror T1. The method says to grade the document actually retrieved, making the relayed copy T4.
- **L-0217** labels UN Comtrade T1, and **L-0218** labels the UN Treaty Series T1. Both are T2 by definition.
- **L-0218, L-0219 and L-0220** label internal retrieval logs, private repository material or the corpus itself T1. None is an official Indian source.
- **L-0021, L-0184, L-0187 and L-0188** label US courts, executive orders, White House material and USTR publications T1. They may be strong primary sources, but the taxonomy defines T1 as Indian official and contains no foreign-primary class.

Tier counts are therefore unreliable as tagged, and the claim that tier tags travel with claims is false for these records.

9. The corpus's self-audits are publicly uncheckable

- **L-0219** gives exact counts - 278 citations, 92 roots and 139 unaddressable citations - but its sole source is an internal repository reference whose public URL returns 404. A reader cannot reproduce the partition or test the threshold.
- **L-0220** claims a systematic pattern across thirteen records and says repository history proves the verdicts predated the synthesis. Its only source is again the private repository.
- **L-0218** relies on an internal verification log, but the cited public URL is the MEA page being tested, not the log containing the procedure and results.

These records may be correct, but within a public instrument they are assertions by the instrument about itself, backed by evidence only its author can inspect. Calling that evidence T1 compounds the problem.

10. Direction of error

The verdict errors lean plainly in the incumbent government's favour:

- L-0014 converts a proxy into worked.
- L-0026 and L-0029 convert partial success into worked.
- L-0047 likely does the same with an unmeasured emissions limb.
- L-0207 invents an objective to produce worked.
- L-0188 gives an overdue deliverable additional time not contained in the commitment.
- L-0209 relabels an explicit but undated promise as having no objective.

The methodological overclaims are more politically mixed. Unsupported publication absences sometimes protect favourable verdicts and sometimes intensify allegations of opacity. L-0226 runs against the government by constructing a conflict from two different quantities.

Overall: the assessment vocabulary is applied with a pro-government tilt, while search and absence errors amplify whichever argument the individual record is already making.

11. What I could not check from this file alone

- Whether the underlying series contain evidence omitted from the prose, especially an actual inflation-expectations measure for L-0014.
- Whether the cited documents support every precise figure and causal statement attributed to them.
- Whether searches described only as nothing retrieved were exhaustive but incompletely documented.
- Whether the July 2026 target in L-0188 was a formal bilateral deadline or an external working assumption.
- Whether an Indian instrument exists stating the objective and terms of L-0207 more concretely.
- Whether the 2015 lodged NDC resolves the missing baseline and scope questions in L-0224 and L-0225.
- Whether MEA published an FMR notification that this retrieval environment could not read.
- Whether the private verification logs and repository history reproduce the counts in L-0218, L-0219 and L-0220.
- Whether the 73-record adversarial selection overstates or understates the prevalence of these defects across the remaining corpus.
